* 'Availability' in relation to a thermal generating station for any period means average declared capacities DCs for all the days during that period expressed as percentage of the installed capacity of the generating station minus normative auxiliary consumption in MW, and shall be computed in accordance with the following formula:

Availability = 10000 x DC / {N x IC x (100-AUX)}%

Where

IC = Installed capacity of the generating station in MW,

DC = Average declared capacity for ith day of the period in MW,

N = Number of days during the period, and

AUX = Normative Auxiliary Energy Consumption as percentage of gross generation generation;

**** 'Plant Load Factor' or 'PLF'** for a given period, means the total sent out energy corresponding to scheduled generation during the period, expressed as a percentage of sent out energy corresponding to installed capacity in that period and shall be computed in accordance with the following formula:

PLF = 10000 x SG / {N x IC x (100-AUX)}%

Where

IC = Installed capacity of the generating station in MW,

SG = Scheduled Generation in MW for the i time block of the the period,

N = Number of time blocks during the period, and

AUX = Normative Auxiliary Energy Consumption as percentage of gross generation generation;
