Report of 3rd Pilot audit of Transmission Tower by the audit team of the committee for Audit of Transmission Tower

1. Background

In pursuance of Ministry of Power Letter No. 3/5/2017-Trans. Dated 07.08.2017, for the audit of the transmission towers with respect to design and the life of the towers (on a 5% sampling basis), the 3rd pilot audit was carried out for the towers of the transmission lines (tabulated below) on 20th ,21st & 22nd April, 2018, wherein the following members participated:

- i) Shri Sanjay Srivastav, Chief Engineer, PSE&TD, CEA (on 22.04.18)
- ii) Shri Santosh Kumar, Deputy Director, CEI, CEA
- iii) Smt Kavita Jha, Deputy Director, PSE&TD, CEA (on 20.04.18 & 21.04.18)
- iv) Shri Faraz, Assistant Director, PSE&TD, CEA (on 20.04.18 & 21.04.18)
- v) Shri Mukul Kumar, Assistant Director, CEI, CEA
- vi) Shri D Revanna, Representative of CPRI
- vii) Shri Nitish Kumar Sinha, Asst. General Manager, PGCIL

The members selected the towers in these lines for auditing based on its locational criticality like Highway crossings, in irrigated land, accessibility, etc. The details of the audit of tower of following lines with tower locational information are given below: -

SI	Name of Transmission line	Utility	Tower no. (its	Year of	Audit date
no.			location)	commissioning	
1	400 kV Jalandhar-Sambha D/C	Sterlite	a. 7 (Near NH	2016	20.04.18
	Transmission Line	Power	Crossing)		
		Trans Ltd.	b. 15 (near		
			irrigated land)		
			c. 20 (near irrigated		
			land)		

2	400 kV Malerkotla- Amritsar D/C	Essel Infra	a. 91/3 (in irrigated	2016	21.04.18
	Transmission Line	Projects	field)		
		Ltd.	b.94/0 (near		
			irrigated land)		
			c. 90/0 (near		
			irrigated land)		
3.a.	400 kV Agra (PG)-Agra (UP) D/C	PGCIL	a. 36.b (in	2008	22.04.18
	Transmission Line		agricultural field)		
3.b.	765 kV Agra – Jhatikara S/C	PGCIL	a.172 (in	2015	
	Transmission Line		agricultural field)		

2. Following tests/ checks were conducted for tower audit: -

a. Visual inspection of the tower

The towers were inspected with the naked eye and with the use of binoculars for missing members and bolts, buckling, etc. Danger plate which is for safety, number plate, phase sequence markings which is for convenience and anti-climbing arrangement/device which prevents un-authorized climbing on the tower were also inspected.

Any missing force bearing members will cause uneven distribution of forces in the leg and the capacity of the leg will be reduced which in turn harm the safety of the tower & causes failure of towers/ cascading of failures if it is in the angle/section towers.

Any missing redundant members in the structure will cause uneven distribution of forces in the force bearing members to which they are connected thus reducing the capacity of force bearing members. It will cause more stress in the members & may leads to failure of towers even if the field/climatic conditions are normal for which the line/towers are designed.

Similarly, missing bolts of member's connection will cause reduction in strength of joint and causing excessive stresses in the intact bolt of a joint leading failure of joint/s & in-turn may lead to failure of tower.

Figure 1. Missing bolt in bracing

Observation & Conclusion: Buckling of a secondary member in tower no. 20, Anti climbing devices (ACD) were found partially damaged in the tower no. 15 & 20 of 400 kV Jalandhar-Sambha D/C Transmission Line. Anti-climbing device was absent in the tower no. 91/3 & 94/0 of 400 kV Malerkotla- Amritsar D/C Transmission Line, bending of a member and also step bolts were found below ACD level in all the towers of this line. Moreover, the peak was damaged, bolts were missing & ACD was absent in the tower of 400 kV Agra (PG)-Agra (UP) and a bracing was found to be missing from 765 kV Agra – Jhatikara S/C Transmission Line, details of which can be referred from **Annexure**.

Conclusion: Some parameters of Tower structure were not found in adequate condition as mentioned in **Annexure**.

Figure 2. Buckled member

Recommendation: Missing ACD shall be installed, step bolts below ACD shall be removed,

Bent/buckled members to be replaced at the earliest, Dummy bolts, missing step bolts need to be plugged in order to keep the line in healthy condition. Inspection / patrolling of towers to be carried out regularly.

Figure 3. Damaged Anti Climbing Device (ACD)

b. Dimensions of the base width, diagonal length, leg members, bracing members of the bottom panel

The exact overall dimensions of tower structure as a whole like base width & diagonal are necessary for ensuring actual strength of tower for normal functioning of tower for which it is designed. Similarly, the size of tower members shall be within the tolerance limit so that the strength of tower as whole will not be under threat.

The measurements of tower footings, stubs, and reachable members were taken. The length, width and diagonal measurements of tower structure were also taken.

Observation: The recorded readings are given at **Annexure**.

Conclusion: Except the bracings of tower no. 36b of 400 kV Agra (PG)-Agra (UP) D/C Transmission Line & tower no. 172 of 765 kV Agra – Jhatikara S/C Transmission Line, rest dimension of other members of the towers of this line were within limits.

Recommendation: Tower Drawings shall be followed during entire process of erection. It is essential to carry out pre stringing /charging inspection for each of the tower of a line and record the same. The members having dimensions not within limits shall be replaced by the members having correct dimensions.

c. Galvanized coating details of members in the leg portion

The galvanized coating protects the tower material from corrosion due to various pollutants persistent in air. The reduction/erosion of coating may lead to corrosion and reduction in

original dimensions of tower member/s thus reducing the capacity of member/s which may lead to failure of tower. The thickness of coating was measured with the use of Alcometer.

Observation: The recorded readings are given at **Annexure**.

Conclusion: inadequate Coating thickness were found at few locations at leg of tower no. 15 of 400 kV Jalandhar-Sambha D/C Transmission Line.

Recommendation: Coating thickness shall be measured periodically and prompt action shall be taken to protect the tower/structure from corrosion by applying anti corrosive painting.

d. Corrosion to members

Corrosion is a natural process, which converts a refined metal to a more chemically-stable form, such as its oxide, hydroxide, or sulfide. It is the gradual destruction of materials due to exposure to environment. Corrosion leads to loss of section size of structure and in turn reduces the strength of structure. The towers were observed for corrosion.

Observation: No Corrosion were found on the members of the transmission towers.

Conclusion: The members shall be maintained in adequate condition.

Recommendation: The members, stub shall be maintained in dry condition. Water logging shall be avoided. Periodical inspection and anti-corrosive painting shall be applied for the tower members where ever onset of corrosion is noticed.

e. Differential settlements of towers

The foundation settlement occurs when the soil beneath a structure/ footings cannot bear the force imposed by the tower structure and conductor or the design parameters for foundation as per the soil under consideration turns erroneous. The settlement of a structure is the amount that the structure sinks after construction in all the four footings or differential settlement of footings. In case of uniform settlement of tower/s there may not be much problem for the structure. However, differential settlements of legs/ footings become a big problem when the foundation settles unevenly causing additional stress in the tower members. The more uneven in the settlement, the greater shortcoming on the safety of the structure & the reliability causing premature failures, even when the field conditions are normal and all deviations are within limits. Water tube method was used to know the differential settlement of the tower. The level of the stubs of all the four legs of the tower was measured and compared with respect to each other.

Figure 4. unexposed chimney

Differential settlements may lead to following problems: -

- i) Tower may tilt towards settled side that may in turn produce strain in erected conductors and may cause snapping.
- ii) Tower may collapse that will have cascading effect and adjacent towers may also be affected.

Observation: The recorded readings are given at **Annexure**.

Figure 5. Measurement of base width

Conclusion:

SI	Name of Transmission line	Tower whose Differential settlement were found		
no.		not within limits		
1	400 kV Jalandhar-Sambha D/C Transmission Line	Tower no. 15		
2	400 kV Malerkotla- Amritsar D/C Transmission	Tower no. 91/3, 94/0, 90/0		
	Line			
За.	400 kV Agra (PG)-Agra (UP) D/C Transmission	Tower no. 36b		
	Line			

while the rest of the towers were within permissible limit.

Recommendation: The land around tower footing shall be compact, levelled and kept dry to provide strength to the soil. Water logging shall be avoided if the foundations of a given tower location is not designed for wet condition, condition and also suitable corrective measures shall be taken for the towers where the differential settlement is not within permissible limits.

f. Verticality of tower

This test was done to find out any undue eccentricity/leaning of the tower created due to constructional problem if any and or created by wind, excessive line loading buckling of towers, differential settlement of foundation, etc. The procedure adopted for this was by identifying the center of the tower and then measuring through the transverse & longitudinal axes taking reference of the intersection of bracings of bottom panel of the tower and tracking through the overall height of the tower up to the intersection of bracings of top panel of the tower by use of Total station in both the directions.

Observation: The recorded readings are given at **Annexure**.

Conclusion: The deviation in verticality for tower no. 90/0 of 400 kV Malerkotla- Amritsar D/C Transmission Line could not be measured as measurement was not feasible there and the deviation in verticality for rest all towers were well within limits.

Recommendation: To avoid the eccentricity & deviation in verticality, the stubs to be casted to the correct position (Base width and Diagonal) & to the correct inclination (slope) and also at common level. The surface near the tower footing shall be regularly inspected and maintained in condition to withhold the tower. Due care shall be taken during stringing to maintain the correct sag tension coordination for a given span.

Figure 6. Transverse view of Verticality
