# Ensuring adequacy in the planning and development of Inter State Transmission System

## 1.0 Background

The planning of transmission system to meet long term requirements of ISGS (Inter State Generating Station) projects is being carried out since 1975. In earlier time the ISGS only consist of generating stations of central sector companies i.e. NTPC, NHPC, NLC, NPCIL etc. Slowly, the predominance of central sector projects which have known beneficiaries (as determined by central government in the form of allocations) started fading out and now more and more of private sector generation projects (IPPs) are being envisaged. The current generation addition programme of 88 GW during 12<sup>th</sup> Plan has 47 GW under private sector as compared to only 26 GW under central sector.

The planning of transmission system for central ISGS was carried out with the prior knowledge of quantum of power, point of injection and point of drawal. Even for transfer of 15% unallocated power to different parts of the country, from time to time, there was rarely any problem of congestion because of the inherent margins built-up in transmission system to take care of flexibility required for transfer of 15% of unallocated capacity.

The CERC Regulation for open access in Inter-State Transmission System (ISTS) was introduced in 2004. The regulation had the provision for obtaining Long Term Access (LTA) and Short Term Open Access (STOA). The information about the point of injection, points of drawal and the quantum were required to be furnished upfront. The request for fresh connectivity to ISTS was processed simultaneously with the grant of LTA.

As the IPPs found difficulties in finalizing beneficiaries at the time of LTA application, CERC brought new Regulation in 2009 having separate provisions of Connectivity, Medium Term Open Access (MTOA) and Long Term Access(LTA). The 2009 regulations for LTA do not require upfront declaration of firm beneficiaries. It requires the IPPs to declare the target region of anticipated drawal.

## 2.0 Transmission planning for ISGS as per present CERC regulations

### 2.1 Salient Features of LTA

- LTA involves requirement of power transfer from 12 to 25 years.
- If strengthening of transmission system is required for reliable transfer of the LTA quantum, the process of grant of LTA should be completed at least 4-5 years prior to commencement of LTA due date.
- For 'LTA Point-to-point' (i.e. with finalized beneficiaries), the point of injection, point of drawal and quantum of power transfer should be known. In this case, the relevant injection and drawal charges are recovered from the buyer.
- For 'LTA with Target Region', the point of injection, target region of drawal and quantum of power transfer should be known. In this case, the injection and drawal charges of the target region is being paid by the generation.
- **Till August 2013, CTU had received 218 nos. of Applications for Long-term Access with Installed Capacity of 1,79,300 MW and LTA sought was for 1,32,000 MW. Out of this, LTA was granted to 148 nos. of Applicants for LTA quantum of 83,000 MW. Details are given at Annex-I.**

### 2.2 Salient Features of MTOA and STOA

- MTOA/STOA provides the opportunity of selling and buying power from any location (source) to any location(destination) in the grid.
- MTOA involves requirement of power transfer from 3 months to 3 years while STOA involves requirement of power transfer up to 3 months.
- **No augmentation in the transmission system is carried out for grant of MTOA/STOA. The grant of MTOA/STOA is based on the available margin in the existing/under-construction transmission system.**
- Out of 98 applications received by CTU seeking MTOA for about 14,300 MW, the MTOA was granted to 48 nos. applicants for 4,400 MW. All MTOA were processed however the MTOA was granted where transmission margins were available. The details are given at Annex-II.
- The number of STOA transactions cleared every year is very large as depicted in the following graph:

### 2.3 Salient features of regulations for Connectivity

- Under this provision, the generator can request to get connected to the ISTS system without any upfront commitment for sharing of transmission charges.
- The provisions of Connectivity do not mandate for system strengthening and thus do not ensure delivery of power from the connected generator. This generator leans on the existing grid, causes congestion and risks stability of the grid.
- There is a need to make the concept of Connectivity meaningful by allowing system strengthening to be done commensurate with the installed capacity of the generating station seeking Connectivity.
- Till August 2013, CTU had received 188 nos. of applications for the installed capacity 1,94,300 MW. Out of this, Connectivity was granted to 84 nos. applicants for about 85,000 MW installed capacity. The details are given at Annex-III.

### 2.4 The present planning process

- The planning of transmission system for new ISGS seeking LTA is carried out based on the quantum of power, point of injection, point of drawal, time frame requirement of power transfer etc.
- Transmission schemes are also evolved as grid strengthening schemes based on the projected likely future power scenarios and operational feedback.
- The transmission system so planned has transmission margins which inherently get created on account of the following:

- planning for peak power transfer,
  - requirement to meet specified reliability criteria(N-1/N-1-1),
  - adoption of higher capacity or higher voltage transmission line to conserve ROW for future generation potential or power transfer requirements,
  - the lumpy nature of transmission elements,
  - the transmission capacities are created in steps, and
  - Actual operational condition from time to time.
- The transmission margins are utilized for power transfer under MTOA and STOA.

### 3.0 Issues in the present planning process

#### 3.1 Regarding creation of adequate transmission system

- CERC regulations allow system strengthening (fresh investment) on the basis of application for LTA. **No system strengthening can be done for giving Connectivity, MTOA or STOA.** The investment of the transmission system is therefore made on the assurance of payment of transmission charges for a longer period by the LTA users.
- The existing philosophy is based on the premise that long term PPAs are predominant. Short term market, seeking MTOA/STOA, shall be catered through available margins.

#### 3.2 Regarding drawal capacity for States

- Historically, additional drawal capacity for the States was created whenever new central/ISGS power projects came up with known beneficiaries. New drawal points/capacity additions for States were created on request by the STU considering the quantum of allocated power and grid requirements after agreement in the Standing Committee for power system planning.
- There are no clear formulations in CERC regulation for creation of drawal capacity for the States corresponding to the grant of 'Connectivity' or the 'LTA with Target Regions'.

#### 3.3 Regarding 'Connectivity' provisions

- CERC regulations provide for free of cost connectivity to ISTS. This provides perverse incentive for generators to under-declare their transmission requirement and to piggy ride on the existing transmission network. By simply

getting connectivity, the generation developer can avoid the liability of paying monthly transmission charges which would be payable under LTA service.

### **3.4 Regarding target region LTAs**

- Under this service, the generation developer has to undertake to pay transmission service charges (PoC injection + PoC notional drawal) for 25 years. However in lieu of the above commitment to pay, the generation developer is not provided any service at all as long term customer. Generation developers who seek LTA (target region) have to separately stand in the queue for MTA or STOA for actually scheduling their power. The charges paid by them for availing MTA or STOA service are not adjusted against their monthly LTA bill if they sell power outside the declared target region or through PX. This is resulting in double payment by the generators.
- The generation developers are resorting to LTA based on target region as they are not able to finalise the long term beneficiaries. The root cause of this is that the power procurements through Case-I bidding route are not getting finalized by the respective States and also due to delay in bidding process and various litigations. Significant amount of power transfer takes place under MTOA/STOA. This is leading to congestion in various transmission corridors across the country. The difference between LTA and total drawal by the states is depicted below, and the details are given at Table(3.4):

**Drawal Pattern of States**  
Difference (MW) of Max. Drawal and Allocation (MW)

**Drawal Pattern of States**  
% Drawal above LTA Quantum

#### 4.0 Need for a new approach

- A way out has to be found as the long term PPA may not materialize at the time of planning for transmission to a significant extent. The existing transmission service products need to be reviewed as well as the approach to planning so as to provide flexibility to buyers and sellers. New transmission systems would have to be developed to cater to the need of short/ medium term market including power exchanges (PX). However, any fresh investment should be supported by commitment to pay for it. States like Punjab, Tamil Nadu, Gujarat, UP etc. who are availing far more import capacity through ISTS than their LTA capacity should proportionally share the PoC charges at the point of drawal.
- We have to recognize the fact that short/ medium term market can no longer be restricted to “spare magins” on the lines, which was the basic premise of the first open access regulations introduced in 2004 when long term PPAs were predominant. As of now fresh investment in transmission is permitted only for providing long term access. It needs to be recognized that in the current scenario if short term/ medium/PX transactions are curtailed it results in significant bottling up of generation and distress to Discoms.
- It is required that:
  - The IPPs/generators should be given comfort to sell their powers under long/medium/short-term time frame with lesser congestion events.
  - The transmission system is built with due commitment from its users i.e. the (i) injectors (generators, captive plants and surplus State utilities) and (ii) drawing entities (State utilities and bulk consumers).
  - The stranded transmission assets do not get created.
  - Sharing of transmission charges becomes fairer and equitable with commitment from all stake holders that is STOA/MTOA customers, injecting entities and LTA costumers.
- Since a strong all India mesh grid would emerge by end of 12<sup>th</sup> Plan i.e. 2016-17, it should be possible to do planning with fair degree of certainty without prior knowledge of pairs of injection and drawal. System strengthening for additional drawal and additional injection could be done without knowing the contracted source of purchase or sale because power in a meshed network would be transferred by displacement. In other words, the generator and the States/Consumer could be given **General Network Access** (GNA) to ISTS for the agreed quantum of power (MW). While granting GNA the generation

and load scenarios and other assumptions would be declared by the Central Transmission Utility (CTU). A GNA agreement could become the driver for investment.

- The new approach should therefore involve introduction of General Network Access (GNA) mechanism in Inter-State Transmission System for transmission system development and hassle free access to the transmission system by the Generators.

## **5.0 General Network Access(GNA)**

### **5.1 The definition of GNA**

- **GNA is the ability in MW to draw or supply from a given point/zone of connection (PoC) to any ISTS point as assessed by the CTU through system studies.**
- The concept of PoC charges has de-linked the transmission charges and losses from the notional path of transaction. GNA is also not path specific. Accordingly, charges for GNA could be aligned with the PoC mechanism.

### **5.2 Process for implementation and grant of GNA**

- Generators would need to specify the ex-bus installed capacity connected with the ISTS grid (in case of captive plants - maximum power they plan to inject into the grid) as requested GNA quantum for injection.
- States need to specify their maximum power drawal requirements as requested GNA quantum for drawal.
- The effective GNA would be as assessed by CTU through system studies and considering the transmission system planned through the coordinated planning process of CEA.
- The States, which are also planning to inject into ISTS, would need to specify the quantum of maximum power injection as requested GNA quantum for injection.
- For availing GNA, the injector (i.e. the generator or the surplus State) shall not be required to specify target customer.
- Similarly, the drawing entities (the deficit States or the bulk consumers) shall not be required to specify the source of supply of power.
- GNA holders shall have option to avail

- LTA point to point (i.e. having PPA with beneficiaries)
- MTOA
- STOA
- GNA (drawl / injection) to be assessed by the generators, bulk consumers or States at least with 4-5 years in advance.
- System strengthening for drawal by the States would be driven by GNA
- States shall have to sign the GNA with CTU to be treated as preferred customer.
- STUs of respective state to be nodal agency for above in line with Section-39 of the Act
- Entities seeking GNA shall have to sign agreement, furnish BG etc. for enabling implementation of the transmission system.
- All existing LTA, or long-term allocations should be converted to GNA.
- **The transmission service under ‘Connectivity’ and ‘LTA with target regions’ gets replaced by GNA.**
- The difference between LTA/ MTA/ STOA users shall be in the priority of scheduling.

### **5.3 The tenures under GNA mechanism**

- The GNA may be for a period of 12 years to ensure recovery of investment in transmission.
- For scheduling under GNA, it is proposed that - the LTA Point-to-point can be for a minimum period of 5 years, MTOA for one year fixed tenure, with window opening twice a year, and the STOA for period up to 1 month.

### **5.4 Broad Pricing Mechanism of GNA**

- Transmission rates to be calculated considering GNA
- GNA holder would pay POC injection or drawal charges as the case may be.
- Generators/drawing entity will pay GNA charges from the contracted date or actual date whichever is earlier
- Any power transfer beyond the GNA capacity may be entertained only for STOA service at a premium rate.

## **5.5 Benefit of GNA**

- New transmission corridors could be planned based on GNA requirement, which would help in a great way to remove congestion in transmission corridors.
- Generators shall not be liable to pay notional point of drawal charges
- Generators shall not have to declare target beneficiaries
- Generators shall have access to ISTS grid with flexibility for point of drawal subject to conditions laid down at the time of grant of GNA.
- Drawing Utilities shall also access to ISTS to the extent of their GNA and get the system created for power transfer over ISTS from anywhere in the grid.

## **6.0 Action Points**

- CERC to modify the regulations on 'Connectivity, LTA & MTOA', regulation on Short-term Open Access in ISTS and the regulation on sharing of transmission charges to incorporate the GNA concept.
- The planning procedures pertaining to GNA to be incorporated in the CERC regulations / CEA's transmission planning criteria / CEA's coordinated planning procedure.
- CTU along with CEA and POSOCO to workout present GNA capabilities.

Table (3.4)

## Drawal of power by the States in addition to LTA Quantum during 2012-13

S.No.	State	Max. Peak Demand Met (MW)	Max Drawl So far (MW)	LTA Quantum (MW)	Difference (MW) of Max Drawl and Allocation (MW)	Percentage Drawal above LTA Quantum
